

Myopsolenites altus (Geyer & Vincent 2015) (TH110)

Myopsolenites → Redlichiida → Redlichiina → Redlichioidea → Metadoxidae

Provenance : Morocco; Djebel Ougnat

Formation : (most probably Jbel Wawrmast Fm)

Age : Middle Cambrian

Details : Complete specimen, sold to me as "*Omaraspis* sp." (see label). Note the "spinosity" of the rachis (axial lobe) and that of the 11th thorax segment. Reminds me very much of the Bathynotidae; see *Myopsolenites altus* (254 in my collection). In fact, they are far too similar for my comfort, and I guess they're actually the same. Looks like the seller made a wrong diagnosis on this one.
