

cf. *Kingaspidoides* sp. (TH498 + 498a-c)

Kingaspidoides → Redlichiida → Redlichiina → Ellipsocephaloidea → Ellipsocephalidae

Provenance : Morocco, Djebel Saghro

Formation : ? Fm

Age : Cambrian(?-Ordovician boundary)

Details : On one piece with (TH497 + 497a) **cf. *Hapalopleura* sp.** (see there for images) and (499) Trilobita indet. The genus identification is my own, and certainly open to scrutiny and I urge anyone to contact me at trilobitehouse@ yahoo.com if you have any corrective comments. If the ID is correct, and assuming that the piece is a composite (see also **cf. *Hapalopleura* sp.**) with trilobites from the same site, then the age would be rather Cambrian Stage 4-5 (in stead of boundary Cambrian-Ordovician). For practical reasons, we'll number the specimen on the right TH498, as it's stretched-out dorsally, and give TH498a to the other stretched-out specimen on the left. TH498b would then be the curved one on the left, TH498c the one on the right. Some of the occipital spines seem to have undergone slight restoration.
