

“Ornamentaspis” frankenwaldensis Wurm, 1925 (TH630)

Ornamentaspis → Redlichiida → Redlichiina → Ellipsocephaloidea → Ellipsocephalidae

Provenance : Germany; Galgenberg bei Premeusel

Formation : Galgenberg Schichten Mbr in Tannenknock Fm

Age : Middle Cambrian

Details : Disarticulated specimen (as part-counterpart internal/external moulds). Visible on first detail images (the one on the left on the second page) is the (regrettably) slightly damaged internal mould of the cranidium and (on the right detail image of page 2) some incomplete thorax segments (text continues on page 2).

Bought on : 3-5/11/2023

Bought at : Palais du Congrès, Liège

Event : Intermineral 2023

The counterpart evidently shows the (equally of poor quality) external mould of the cranium (see above and in more detail on following page), and regrettably far less of the partial thorax segments.

Addition to the collection thanks to a generous gift by Benedikt Magrean.
