

Agnostus → Agnostidae → Agnostoidea → Agnostina → Agnostida

I'm not quite satisfied that this should be a mass-death plate as in the conventional sense...

...as one would expect complete specimens...and what we see here are moults, with plenty of cephalon & pygidia, but not one complete beastie. There's also no thorax segment in sight.

Above : a nice detail photo at maximum magnification, showing pygidia & cephalons of both mature & juvenile specimens. Below : backside of the piece with more specimens.
