

Agnostus (Homagnostus) obesus (Belt, 1867) (TH478)

Homagnostus → Agnostida → Agnostina → Agnostoidea → Agnostidae

Provenance : UK; Purley Quarry, Mancetter works

Formation : “Dolgellau Series”

Age : Cambrian

Details : Part-Counterpart of a complete specimen in part/conterpart moulds. First detail images apparently of the external mould. Detail images of the internal mould done with different lighting angles. If my research work is correct, Mancetter is a suburb village of Atherstone in North Warwickshire and approximately 20 miles (as the bird flies) ENE from the center of Birmingham...which places it in the “Midlands”...renowned for the “Dudley” trilobite *Calymene blumenbachi*. However, Dudley is situated on the “other side” of Birmingham (about 10 miles in a WNW-ern direction...in other words : western direction with a slight northern inclination)...or, how surprisingly different in age strata can be with only a ‘slight’ difference of distance, eh?
